

IBM Developer SKILLS NETWORK

Reading Files Python

Estimated time needed: 40 minutes

Objectives

After completing this lab you will be able to:

- Read text files using Python libraries

Table of Contents

- Download Data
- Reading Text Files
- A Better Way to Open a File

Download Data

```
In [1]: import urllib.request
url = 'https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDriverSkillsNetwork-PY0101EN-SkillsNetwork/labs/Module%201/Example1.txt'
urllib.request.urlretrieve(url, filename)

Out[1]: ('Example1.txt', <http.client.HTTPMessage at 0x107500ac760>)
```

```
In [2]: # Download Example file
```

```
!wget -O /resources/data/Example1.txt https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDriverSkillsNetwork-PY0101EN-SkillsNetwork/labs/Module%201/Example1.txt
```

Reading Text Files

One way to read or write a file in Python is to use the built-in `open` function. The `open` function provides a `File object` that contains the methods and attributes you need in order to read, save, and manipulate the file. In this notebook, we will only cover `.txt` files. The first parameter you need is the file path and the file name. An example is shown as follow:

`file = open("/resources/data/Example1.txt", "r")`

```
graph TD; file[file object] --- filePath[file Path]; file --- mode[Mode]; filePath --- filePath[/resources/data/Example1.txt/]; mode --- modeValue["'r'"];
```

The mode argument is optional and the default value is `r`. In this notebook we only cover two modes:

- `**r**`: Read mode for reading files
- `**w**`: Write mode for writing files

For the next example, we will use the text file `Example1.txt`. The file is shown as follows:

```
This is line 1
```

```
This is line 2
```

```
This is line 3
```

We read the file:

```
In [2]: # Read the Example1.txt
```

```
example1 = "Example1.txt"
```

```
file1 = open(example1, "r")
```

We can view the attributes of the file.

The name of the file:

```
In [3]: # Print the path of file
```

```
file1.name
```

```
Out[3]: 'Example1.txt'
```

The mode the file object is in:

```
In [4]: # Print the mode of file, either 'r' or 'w'
```

```
file1.mode
```

```
Out[4]: 'r'
```

We can read the file and assign it to a variable:

```
In [5]: # Read the file
```

```
FileContent = file1.read()
```

```
Out[5]: 'This is line 1 \nThis is line 2\nThis is line 3'
```

The `\n` means that there is a new line.

We can print the file:

```
In [6]: # Print the file with '\n' as a new line
```

```
print(FileContent)
```

```
This is line 1
```

```
This is line 2
```

```
This is line 3
```

The file is of type string:

```
In [7]: # Type of file content
```

```
type(FileContent)
```

```
Out[7]: str
```

It is very important that the file is closed in the end. This frees up resources and ensures consistency across different python versions.

```
In [8]: # Close file after finish
```

```
file1.close()
```

A Better Way to Open a File

Using the `with` statement is better practice, it automatically closes the file even if the code encounters an exception. The code will run everything in the indent block then close the file object.

```
In [9]: # Open file using with
```

```
with open(example1, "r") as file1:
    FileContent = file1.read()
    print(FileContent)
```

```
This is line 1
```

```
This is line 2
```

```
This is line 3
```

The file object is closed, you can verify it by running the following cell:

```
In [10]: # Verify if the file is closed
```

```
file1.closed
```

```
Out[10]: True
```

We can see the info in the file:

```
In [11]: # See the content of file
```

```
print(FileContent)
```

```
This is line 1
```

```
This is line 2
```

```
This is line 3
```

The syntax is a little confusing as the file object is after the `as` statement. We also don't explicitly close the file. Therefore we summarize the steps in a figure:

We don't have to read the entire file, for example, we can read the first 4 characters by entering three as a parameter to the method `.read()`:

```
In [12]: # Read first four characters
```

```
with open(example1, "r") as file1:
    print(file1.read(4))
```

```
This
```

Once the method `.read(4)` is called the first 4 characters are called. If we call the method again, the next 4 characters are called. The output for the following cell will demonstrate the process for different inputs to the method `.read()`:

```
In [13]: # Read certain amount of characters
```

```
with open(example1, "r") as file1:
    print(file1.read(4))
    print(file1.read(4))
    print(file1.read(7))
    print(file1.read(15))
```

```
This
```

```
is
```

```
1
```

The process is illustrated in the below figure, and each color represents the part of the file read after the method `.read()` is called:

Here is an example using the same file, but instead we read 16, 5, and then 9 characters at a time:

```
In [14]: # Read certain amount of characters
```

```
with open(example1, "r") as file1:
    print(file1.read(16))
    print(file1.read(5))
    print(file1.read(9))
```

```
This
```

We can also read one line of the file at a time using the method `readline()`:

```
In [15]: # Read one line
```

```
with open(example1, "r") as file1:
    print("first line: " + file1.readline())
```

```
first line: This is line 1 \n
```

We can also pass an argument to `readline()` to specify the number of characters we want to read. However, unlike `read()`, `readline()` can only read one line at most.

```
In [16]: with open(example1, "r") as file1:
    print(file1.readline(20)) # does not read past the end of line
    print(file1.readline(20)) # Returns the next 20 chars
```

```
This is line 1
```

```
This is line 2
```

We can use a loop to iterate through each line:

```
In [17]: # Iterate through the lines
```

```
with open(example1, "r") as file1:
    i = 0
    for line in file1:
        print("Iteration", str(i), ": ", line)
        i = i + 1
```

```
Iteration 0 :  This is line 1
```

```
Iteration 1 :  This is line 2
```

```
Iteration 2 :  This is line 3
```

We can use the method `readlines()` to save the text file to a list:

```
In [18]: # Read all lines and save as a list
```

```
with open(example1, "r") as file1:
    FileasList = file1.readlines()
```

Each element of the list corresponds to a line of text:

```
In [19]: # Print the first line
```

```
FileasList[0]
```

```
'This is line 1 \n'
```

Print the second line

```
FileasList[1]
```

```
In [20]: # Print the third line
```

```
FileasList[2]
```

```
'This is line 3'
```

The last exercise!

Congratulations, you have completed your first lesson and hands-on lab in Python.

Change Log

Date (YYYY-MM-DD)	Version	Changed By	Change Description
2022-01-10	2.1	Malika	Removed the readme for GitShare
2020-09-30	1.3	Malika	Deleted exercise "Weather Data"
2020-09-30	1.2	Malika Singla	Weather Data dataset link added
2020-09-30	1.1	Arjun Swami	Added exercise "Weather Data"
2020-09-30	1.0	Arjun Swami	Added blurbs about closing files and read() vs readline()
2020-08-26	0.2	Lavanya	Moved lab to course repo in GitHub

New Line

1)file1.read(4)

2)file1.read(4)

3)file1.read(7)

4)file1.read(15)

Here is an example using the same file, but instead we read 16, 5, and then 9 characters at a time:

```
In [12]: # Read first four characters
```

```
with open(example1, "r") as file1:
    print(file1.read(4))
```

```
This
```

Once the method `.read(4)` is called the first 4 characters are called. If we call the method again, the next 4 characters are called. The output for the following cell will demonstrate the process for different inputs to the method `.read()`:

```
In [13]: # Read certain amount of characters
```

```
with open(example1, "r") as file1:
    print(file1.read(4))
    print(file1.read(4))
    print(file1.read(7))
    print(file1.read(15))
```

```
This
```

```
is
```

```
1
```

The process is illustrated in the below figure, and each color represents the part of the file read after the method `.read()` is called:

```
In [12]: # Read first four characters
```

```
with open(example1, "r") as file1:
    print(file1.read(4))
```

```
This
```

Once the method `.read(4)` is called the first 4 characters are called. If we call the method again, the next 4 characters are called
